

1 You have a **PriceEditor** component that has one property called **price**. How would you use that component?

- <PriceEditor value="25.07">
- <PriceEditor property="price25.07"/>
- <PriceEditor price="25.07"/>

2 You have a **Probability** component that has one property called **price**. How would you make use of that property in the component's own component tree?

3 How does React keep track of changes to data in a naming application? Choose two.

- An internal database
- An external database
- React listener
- React state

4 How does React's virtual DOM recognize when something has changed?

- Only tracks state changes
- Only tracks user input changes
- Only tracks changes to the component tree

5 True or False? You can modify a state variable by modifying it directly.

6 State variables are declared using which symbol?

- colon
- comma
- brace
- symbol

7 Why is it important to use the `set` method that `useState` provides to update your state variables?

- It makes it easy to copy variables
- It makes it easy to update variables
- It makes it easy to read variables

8 What does React call the flow of data changes from child components to parents?

- Reverse flow
- Inverse flow
- Unidirectional flow

9 Properties flow from ...?

- Children to their parent
- Parents to their children

10 Where should state data be placed in a component hierarchy?

- in the higher component hierarchy
- in the original component hierarchy
- in the same component where the data is being used

11 How do you modify the state variables that are passed up to the component hierarchy?

- Using `useEffect` hook in the component
- Using `useContext` hook in the component
- Using `useRef` hook in the component

12 True or False? In the following version of your app involve working with data from a service?

13 True or False? All these components have to be enabled?

14 How does the following piece of code cause the component lifecycle to behave?

```
useState(() => { })
```

- Only after you subscribe to the data
- Immediately on component creation
- Only after the component has mounted
- Only after the component has unmounted

15 How does the following piece of code cause the component lifecycle to behave?

```
useState(() => { }, [state])
```

- Only after you subscribe to the data
- Only after the component has mounted
- Only after the component has unmounted
- Only after the component has been updated

16 How does the following piece of code cause the component lifecycle to behave?

```
useState(() => { }, [1, 2])
```

- Only after the component has mounted and passes the value of 1 or more to the effect
- Only after the component has unmounted and passes the value of 1 or more to the effect

17 Which piece of code will only run the effect on the initial render?

```
useEffect(() => { })
```

```
useEffect(() => { }, [])
```

```
useEffect(() => { }, [1])
```

```
useEffect(() => { }, [state])
```

18 True or False? In the following piece of code, state can be a `func` prop?

```
useState(() => { }, [state])
```

- YES
- NO

1

You have a **PriceEditor** component that has one property called **price**. How would you use that component?

<PriceEditor 23.67 />

<PriceEditor property="price:23.67" />

<PriceEditor price="23.67" />

C

G

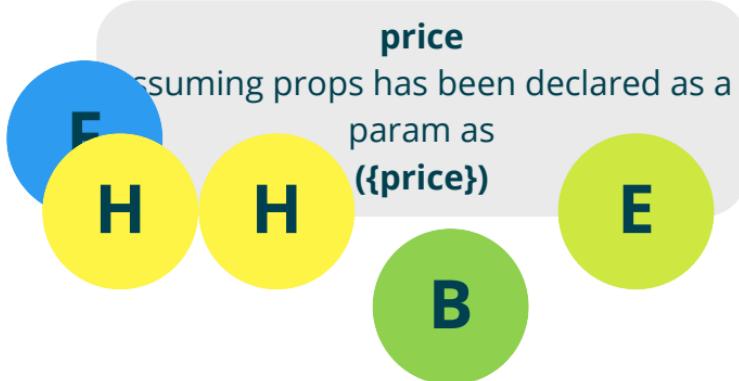

I

B

A

2

You have a **PriceEditor** component that has one property called **price**. How would you make use of that property in the component definition? Choose *two*

3

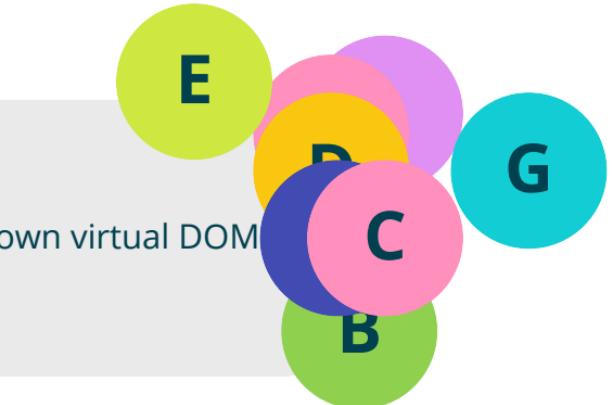

How does React keep track of changes to data in a running application? Choose *two*

An internal database

Its own virtual DOM

The browser's Local and Session storage

State variables

4

How does React's virtual DOM recognize when something has changed?

State hooks cause React to check current and previous state values

Scanning your code's state variables

Use of its diff algorithm

A

G

D

H

E

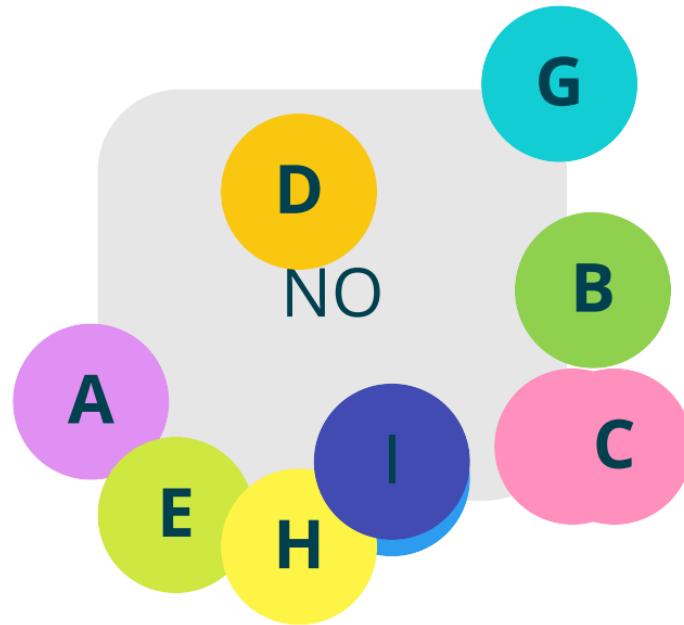

C

5

Yes or No?

You can modify a state variable by modifying it directly.

YES

6

State variables are declared using which syntax?

`const variable = <some initial value>`

`const variable = useState()`

`const [variable, setterForVariable] = useState()`

C

B

G

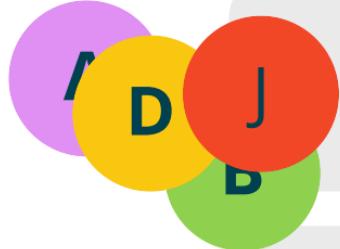

F

C

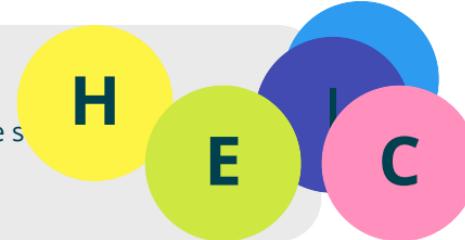

A
D

7

Why is it important to use the setter method that useState() provides to update your state variable?
Choose two

It causes React to perform a diff on the s

It's a safer and OO way of updating the variable

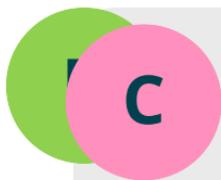

It's a hook that causes React to perform other internal actions

8

What does React call the flow of data changes from child components to parents?

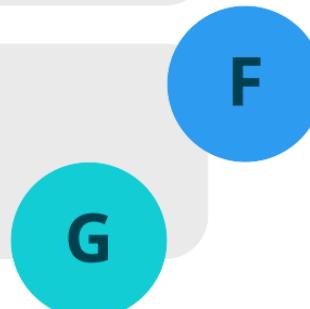

Reverse flow

Inverse flow

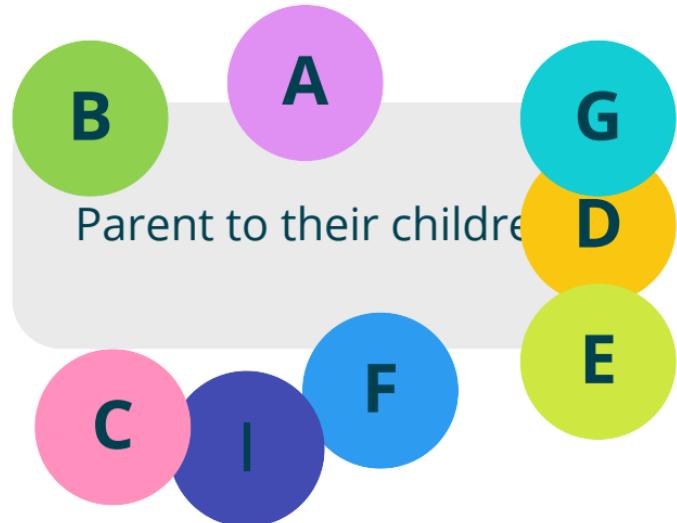

Unidirectional flow

9

Properties flow from...?

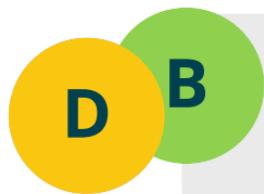

Children to their parent

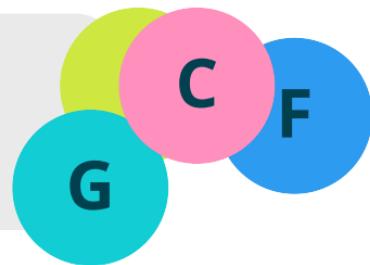

10

Where should state data be placed in a component hierarchy?

In the highest component in the hierarchy

In the highest common component in the hierarchy

In the same component where the data is being used

11

How do you modify the state variables that are higher up in the component hierarchy?

A

C

By providing a callback to the child components

G

B

F

C

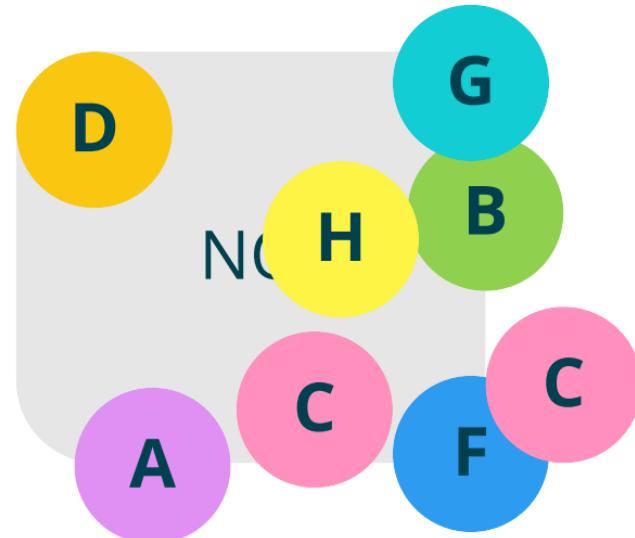

By passing the state variable down the hierarchy as a property

12

Yes or No?

Does a static version of your app involve working with data from a server?

YES

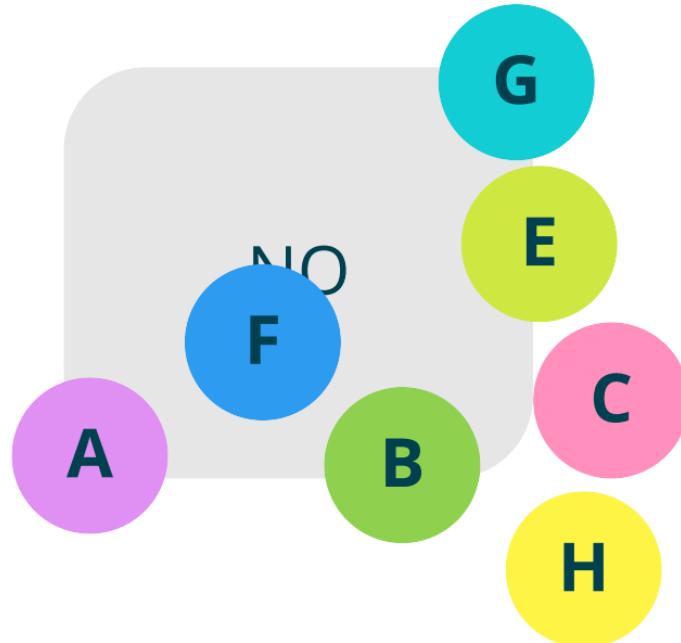

13

Yes or No?

Do all React components have to be visible?

YES

14

How does the following piece of code cause the component lifecycle to behave?

```
useEffect( ()=> { ... } )
```

A
Runs the effect every time for CDM, CDU and possibly CWU

E
Runs the effect only once

B
Runs the effect every time one of its state variables change

J

G

C

F

15

How does the following piece of code cause the component lifecycle to behave?

```
useEffect( ()=>{ ... }, [state1] )
```

B

Runs the effect if the current and previous value of state1 are the same

Runs the effect if the current and previous value of state1 are not the same

Runs the effect if the current and previous values of all other states except state1 have changed

16

How does the following piece of code cause the component lifecycle to behave?

```
useEffect( ()=>{ ... }, [s1, s2] )
```

C

B

D

A

Runs the effect if the current and previous value of s1 or s2 differ

G

E

J

Runs the effect if the current and previous value of s1 and s2 are unchanged

17

Which piece of code tells React to only run the effect on the initial render?

F

E

useEffect() => { ... }, [])

J

B

A

G

useEffect(() => { ... })

useEffect(() => { ... }, [dataState])

18

Yes or No?

In the following piece of code, data can be a React prop?

```
useEffect( () => { ... }, [data] )
```

E

YES

F

C

B

A

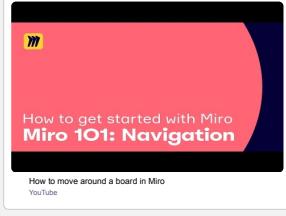

D

G

I

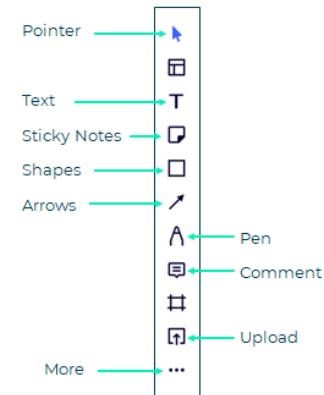

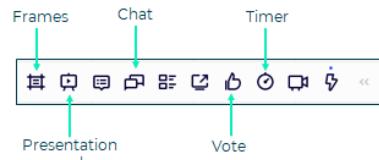

NO

- 1** You have a `PriceEditor` component that has one property called `price`. How would you use that component?
- `<PriceEditor value="25.67"/>`
 - `<PriceEditor property="price25.67"/>`
 - `<PriceEditor price="25.67"/>` ✓
- 2** You have a `PriceEditor` component that has one property called `price`. How would you make use of that property in the component's `componentDidMount` function?
- `componentDidMount() { console.log(price); }`
 - `componentDidMount() { console.log(this.props.price); }`
 - `componentDidMount() { console.log(this.state.price); }`
 - `componentDidMount() { console.log(price25.67); }`
 - `componentDidMount() { console.log(this.props.price25.67); }`
 - `componentDidMount() { console.log(this.state.property); }`
 - `componentDidMount() { console.log(price); } ✓`
- 3** How does React keep track of changes to data in a running application? Choose two.
- An internal database
 - An external database
 - No database is used and instead components are updated
 - Data variables
 - `useEffect()` is used to update components
 - `useRef()` is used to update components
 - `useState()` is used to update components
 - `useContext()` is used to update components
 - `useContext()` is used to update components ✓
 - `useRef()` is used to update components ✓
- 4** How does React's virtual DOM recognise when something has changed?
- Data inside React needs to be checked
 - Keeping your code clean
 - Using its self-updates
 - ✓
- 5** True or False? You can modify a state variable by modifying it directly.
- YES
 - NO ✓
- 6** State variables are declared using which symbol?
- `const variable = useState(initialValue)`
 - `const variable = useState(initialValue)`
 - `const variable = useState(initialValue)`
 - `const variable = useState(initialValue)` ✓
- 7** Why is it important to use the `setInterval` method that `useState` provides to update your state variable?
- It makes it easy to update the state
 - It makes it easy to update the state ✓
 - It makes it easy to update the state
- 8** What does React call the flow of data changes from child components to parents?
- Reverse flow
 - Inverse flow
 - Unidirectional flow
 - ✓
- 9** Properties flow from ... ?
- Children to their parent
 - Parent to their children
 - ✓
- 10** Where should state data be placed in a component hierarchy?
- in the higher component in the hierarchy
 - in the highest common component in the hierarchy
 - in the same component where the state is being used
 - ✓
- 11** How do you modify the state variables that are higher up in the component hierarchy?
- Using `useContext` in the child component
 - Using `useContext` in the parent component
 - ✓
- 12** True or False? In the current version of your app, does it work with data from a service?
- YES
 - NO
 - ✓
- 13** True or False? Do all React components have to be mounted?
- YES
 - NO ✓
- 14** How does the following piece of code cause the component lifecycle to behave?
- ```
useEffect(() => {})
```
- It only runs once when the component is first mounted
  - It runs every time the component is mounted
  - It runs every time the component is unmounted
  - ✓
- 15** How does the following piece of code cause the component lifecycle to behave?
- ```
useEffect(() => {}, [state])
```
- It only runs once when the component is first mounted
 - It runs every time the component is mounted
 - It runs every time the component is unmounted
 - It runs every time the component's state changes
 - ✓
- 16** How does the following piece of code cause the component lifecycle to behave?
- ```
useEffect(() => {}, [1, 2])
```
- Both the effect will run and produce the same value if it is unmounted
  - Both the effect will run if the current and previous values of an array are unmounted
  - ✓
- 17** Which piece of code tells React to only run the effect on the initial render?
- `useEffect(() => {}, []);`
  - `useEffect(() => {}, [1]);`
  - `useEffect(() => {}, [1, 2]);`
  - `useEffect(() => {}, [state]);`
  - ✓
- 18** True or False? In the following piece of code, state can be a React prop?
- ```
useEffect(() => {}, [state])
```
- YES
 - NO
 - ✓

1

You have a **PriceEditor** component that has one property called **price**. How would you use that component?

<PriceEditor 23.67 />

<PriceEditor property="price:23.67" />

<PriceEditor price="23.67" />

2

You have a **PriceEditor** component that has one property called **price**. How would you make use of that property in the component definition? Choose two

props.price

Assuming props is a param of the component

props.price

Assuming props has been declared as a param as
({props})

price

Assuming props has been declared as a param as
({props})

const {price} = useProps()

3

How does React keep track of changes to data in a running application? Choose *two*

An internal database

Its own virtual DOM

The browser's Local and Session storage

State variables

4

How does React's virtual DOM recognize when something has changed?

State hooks cause React to check current and previous state values

Scanning your code's state variables

Use of its diff algorithm

5

Yes or **No**?

You can modify a state variable by modifying it directly.

YES

NO

6

State variables are declared using which syntax?

const variable = <some initial value>

const variable = useState()

const [variable, setterForVariable] = useState()

7

Why is it important to use the setter method that useState() provides to update your state variable?

It causes React to perform a diff on the state data

It's a safer and OO way of updating the variable

It's a hook that causes React to perform other internal actions

8

What does React call the flow of data changes from child components to parents?

Reverse flow

Inverse flow

Unidirectional flow

9

Properties flow from...?

Children to their parent

Parent to their children

10

Where should state data be placed in a component hierarchy?

In the highest component in the hierarchy

In the highest common component in the hierarchy

In the same component where the data is being used

11

How do you modify the state variables that are higher up in the component hierarchy?

By providing a callback to the child components

By passing the state variable down the hierarchy as a property

12

Yes or No?

Does a static version of your app involve working with data from a server?

YES

NO

13

Yes or No?

Do all React components have to be visible?

YES

NO

14

How does the following piece of code cause the component lifecycle to behave?

```
useEffect( ()=> { ... } )
```

Runs the effect every time for CDM, CDU
and possibly CWU

Runs the effect only once

Runs the effect every time one of its state
variables change

15

How does the following piece of code cause the component lifecycle to behave?

```
useEffect( ()=> { ... }, [state1] )
```

Runs the effect if the current and previous value of state1 are the same

Runs the effect if the current and previous value of state1 are not the same

Runs the effect if the current and previous values of all other states except state1 have changed

16

How does the following piece of code cause the component lifecycle to behave?

```
useEffect( ()=> { ... }, [s1, s2] )
```

 Runs the effect if the current and previous value of s1 or s2 differ

Runs the effect if the current and previous value of s1 and s2 are unchanged

17

Which piece of code tells React to only run the effect on the initial render?

useEffect(()=>{ ... }, [])

useEffect(()=>{ ... })

useEffect(()=>{ ... }, [dataState])

18

Yes or No?

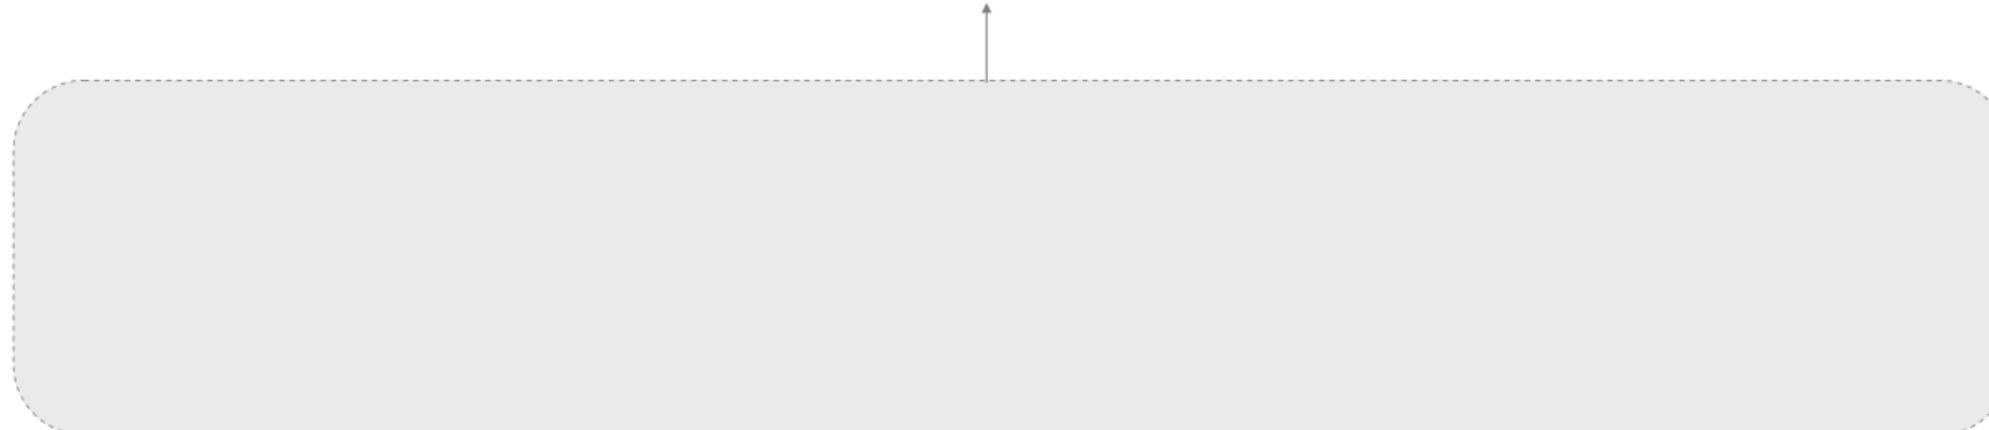

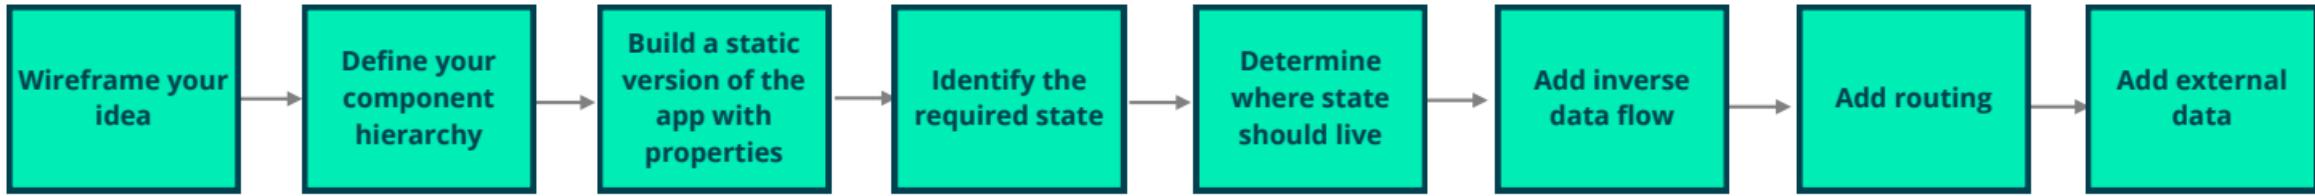

In the following piece of code, data can be a React prop?

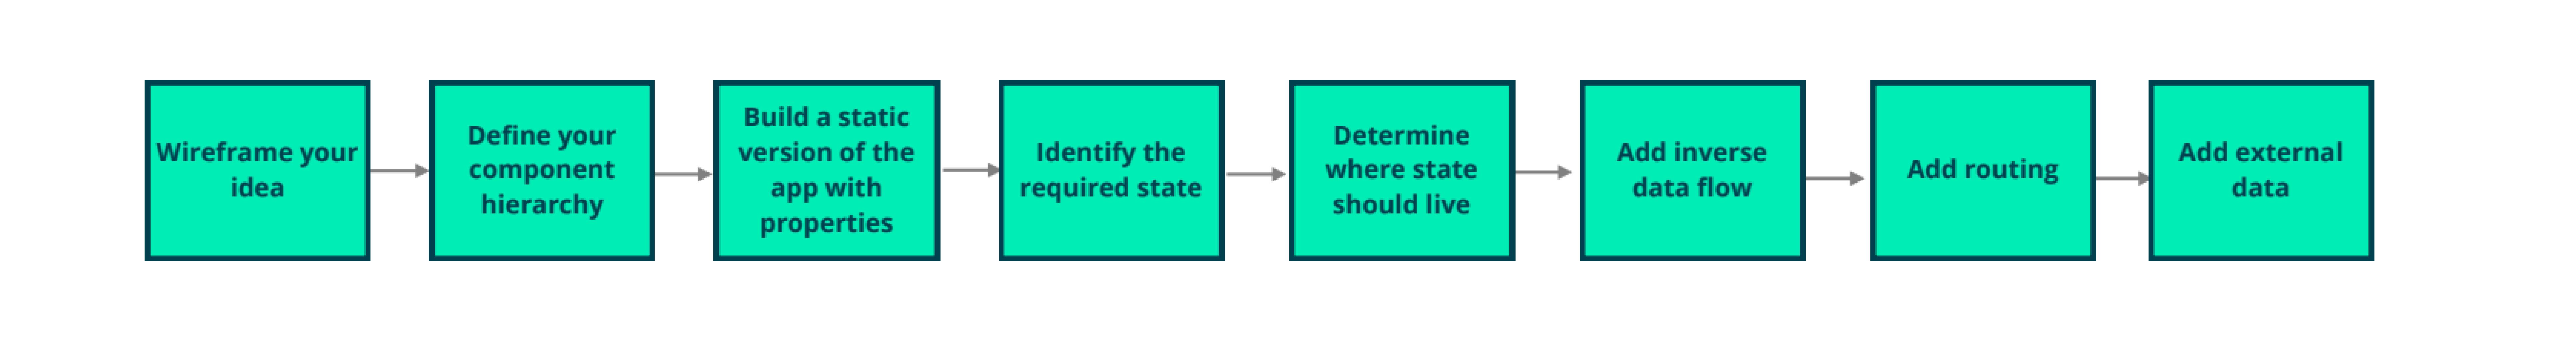

```
useEffect( () => { ... }, [data] )
```

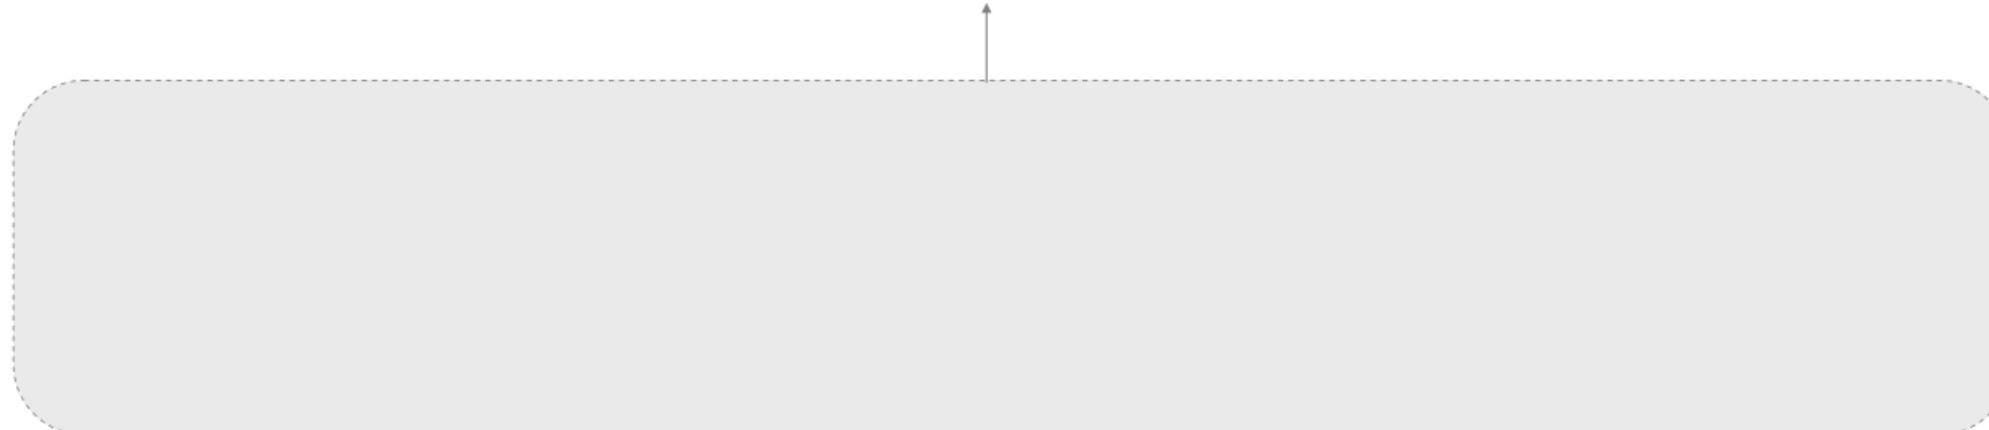

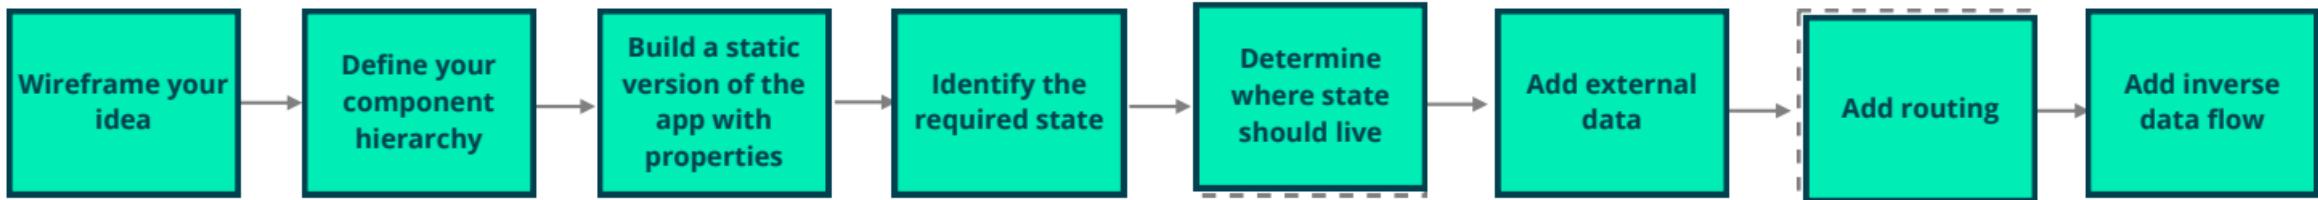

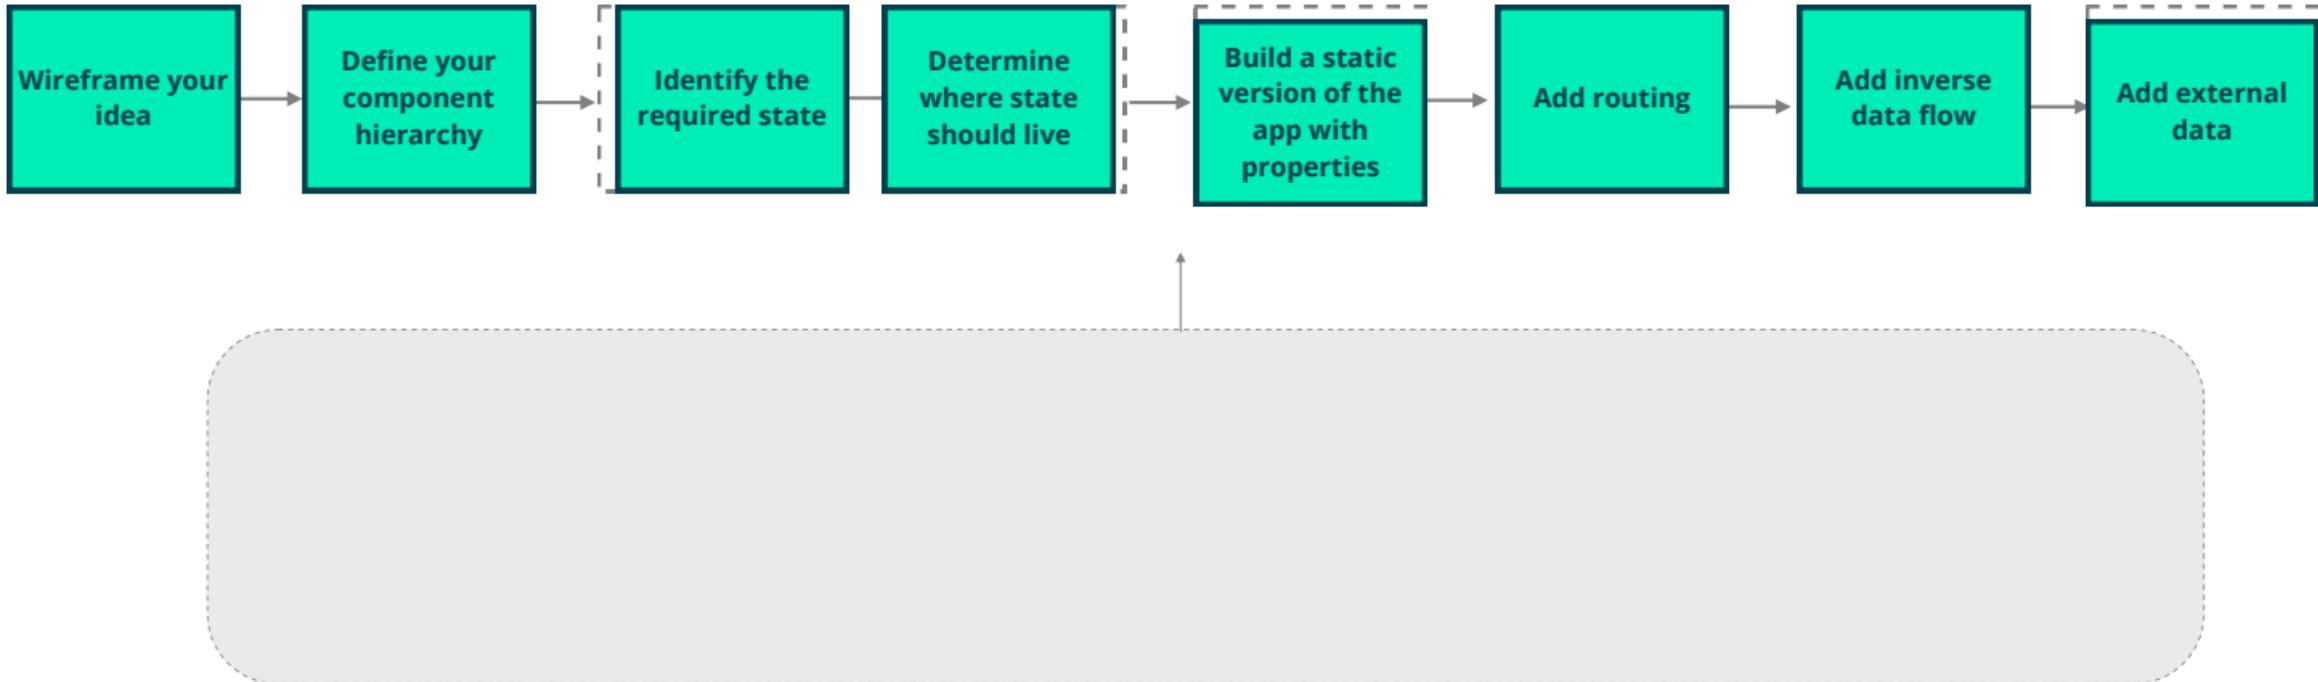

YES

NO

Mini Lab - VAT Calculator

During your Digital Phase you completed labs for a **ToDo** application

As a refresher and to consolidate what you have learnt, you will now develop a simple **VAT Calculator**

The screenshot shows a web browser window with the URL `localhost:3000`. The page title is "VAT CALCULATOR". It features a dropdown menu for "VAT Rate" set to "20%", a text input for "Price excl VAT" containing "50", and a calculated result of "VAT to pay: 10" and "Price incl VAT: 60".

User Stories

1

As a user, I want to be able to calculate the VAT to pay and the net price (price excluding VAT) given the gross price of an item (price including VAT).

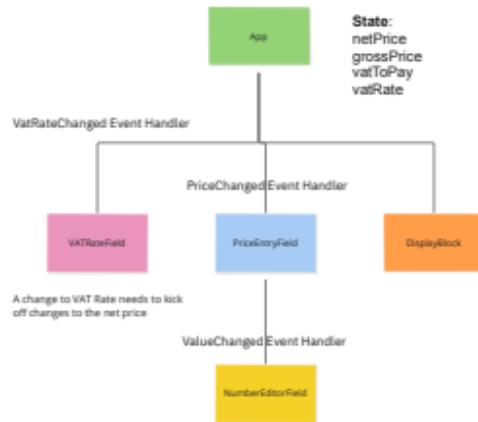

2

As a user, I want to be able to adjust the VAT rate so that I can meet different government VAT requirements. The VAT rates should be 20%, 15%, 12.5% and 0% (Exempt).

3

As a user, I want to be able to calculate the total VAT to pay on an item and the total cost of the item including VAT (gross price) given its price excluding VAT (net price).

Suggested Components

The screenshot shows a web browser window with the URL `localhost:3000`. The page title is "VAT CALCULATOR". The "VAT Rate" is set to "20%". The "Price excl VAT" input field contains "50". The "VAT to pay" output field contains "10". The "Price incl VAT" output field contains "60".

Code in Pairs

Option 1

Code the solution for the VAT calculator in pairs.

Option 2

Code the solution for the VAT calculator along with your instructor.

Mini Lab - Key Takeaways

Add stickies describing your key takeaways from this activity.

Step 1:

Create a **Dockerfile** in the root of your React Application directory

```
vat-calculator > 🏡 Dockerfile > ...
1  # Set the base image to node:17-alpine
2  FROM node:17-alpine as build
3
4  # Specify where our app will live in the container
5  WORKDIR /app
6
7  # Copy the React App to the app directory in the container
8  COPY . /app/
9
10 # Install the app dependencies
11 RUN npm install
12 # Build a production version
13 RUN npm run build
14
15 # Prepare nginx
16 FROM nginx:1.21.6-alpine
17 # Copy the built react app from alpine container to nginx container
18 COPY --from=build /app/build /usr/share/nginx/html
19 # Copy our new config file for nginx
20 COPY nginx/nginx.conf /etc/nginx/conf.d/default.conf
21
22 # Start nginx|
23 EXPOSE 80
24 CMD ["nginx", "-g", "daemon off;"]
25
```

Right click picture and select
"Send to back" to reveal copyable code

Step 2:

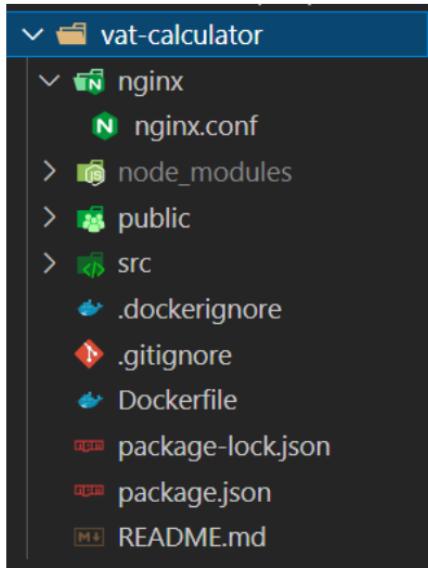

Create a **.dockerignore** file in the root of your React Application directory

```
vat-calculator > ⚡ .dockerignore
  1   node_modules
  2 |
```

Step 3:

Create an **nginx** folder in the root of your React Application folder.

Add a file: **nginx.conf**

```
vat-calculator > nginx > N nginx.conf
1 server {
2
3     listen 80;
4
5     location / {
6         root    /usr/share/nginx/html;
7         index  index.html index.htm;
8         try_files $uri $uri/ /index.html;
9     }
10
11    error_page 500 502 503 504 /50x.html;
12
13    location = /50x.html {
14        root /usr/share/nginx/html;
15    }
16
17 }
```

Right click picture and select "Send to back" to reveal copyable code

Step 4:

Build your docker image and tag it as **vat-calculator:1.0**

```
C:\Total_LearningReact\ReactDemos\vat-calculator>docker build --tag vat-calculator:1.0 .
[+] Building 671.4s (18/18) FINISHED
=> [internal] load build definition from Dockerfile
=> => transferring dockerfile: 631B
=> [internal] load .dockerignore
```

docker build --tag vat-calculator:1.0 .

Step 5:

Verify your image exists using the **docker images** command

```
C:\Total_LearningReact\React\React-Demos\vat-calculator>docker images
```

REPOSITORY	TAG	IMAGE ID	CREATED	SIZE
vat-calculator	1.0	36c290509464	4 minutes ago	20.9MB
mongo	4.2	0df68ce04956	5 days ago	388MB

Create and run a container based on the image

Name the container **vat-container** and expose it on an un-used port, for example: **4250**

```
C:\Total_LearningReact\React\React-Demos\vat-calculator>docker run -p 4250:80 -d --name vat-container vat-calculator:1.0  
783b0b28dbdf014302b4e04ffcbefdd5fdc40152a125e1dfc7368247d177d
```

docker run -p 4250:80 -d --name vat-container vat-calculator:1.0

Step 6:

Browse to the port you exposed and confirm your application is running.

The screenshot shows a web browser window with the address bar displaying "localhost:4250". The main content area is titled "VAT CALCULATOR". A green rectangular box highlights the input fields for VAT Rate, Price excl VAT, VAT to pay, and Price incl VAT. The "VAT Rate" dropdown shows "20%". The "Price excl VAT" input field contains "10". The "VAT to pay" text area displays "2". The "Price incl VAT" input field contains "12".

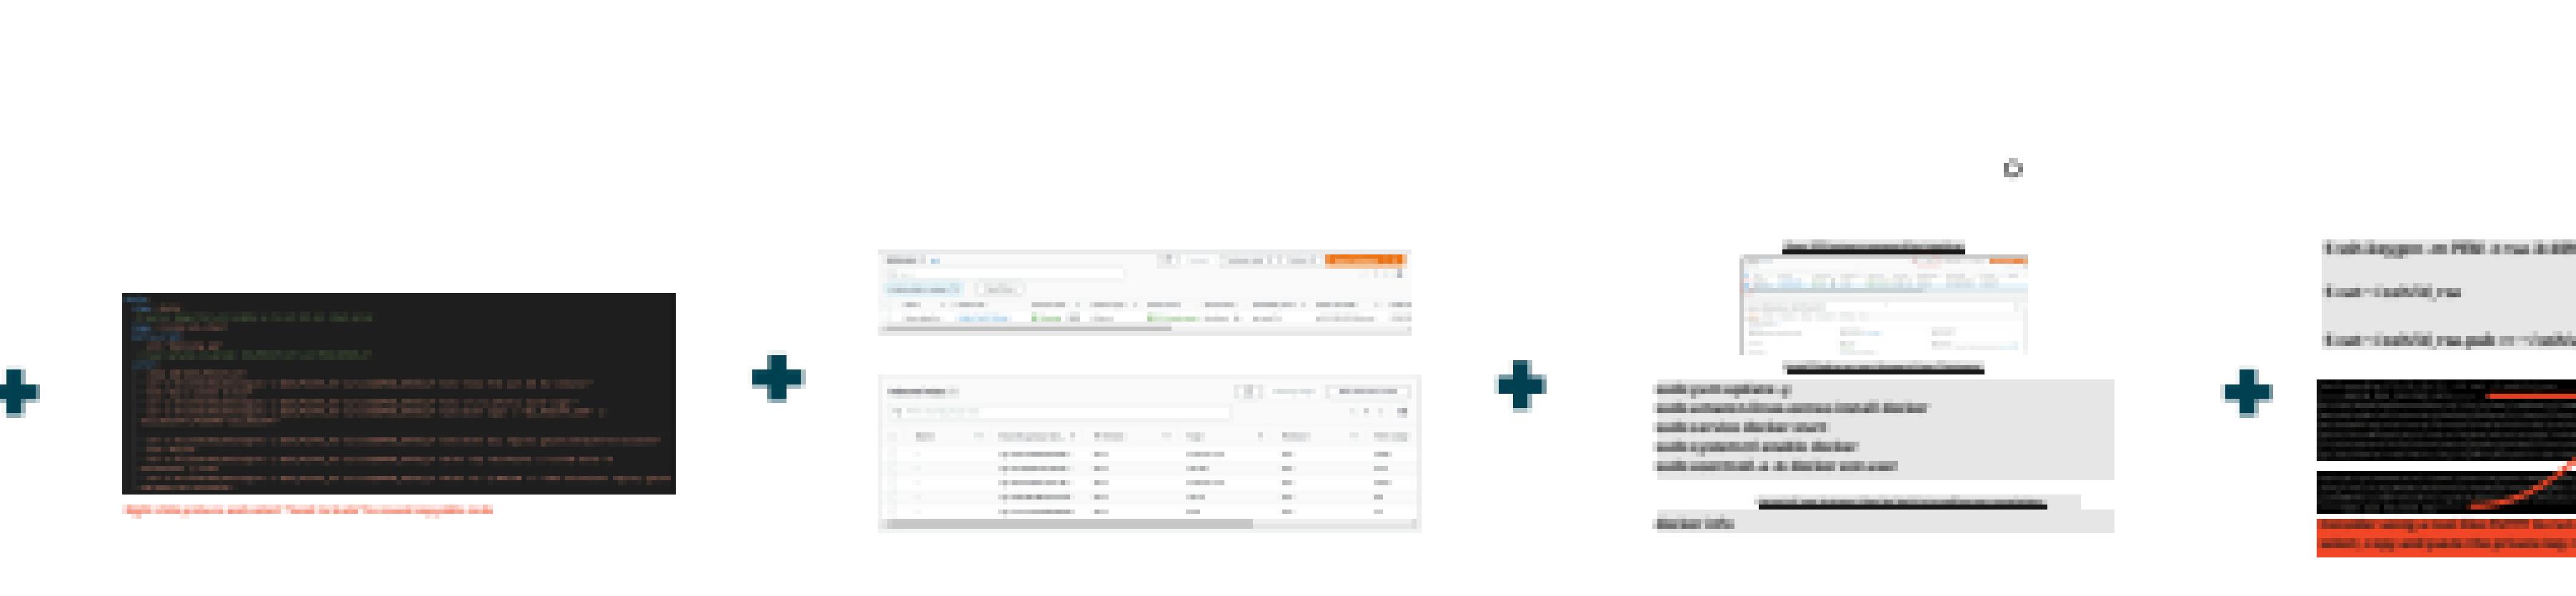

VAT CALCULATOR

VAT Rate: 20%

Price excl VAT: 10

VAT to pay: 2

Price incl VAT: 12

.gitlab-ci.yml

```
vat-calculator > ❤ .gitlab-ci.yml > ...
    gitlab-ci (ci.json)
1   # A BUILD stage to confirm the React App Builds
2   # A TEST stage to run any React tests

The screenshot shows the AWS Management Console's Instances page. There are two instances listed: 'MyInstance' (running, t2.micro, eu-west-2b) and 'MyVATCALCUL...' (running, t2.micro, eu-west-2b). The 'Connect' button for the first instance is highlighted with a red circle.

Name	Instance ID	Instance state	Instance type	Status check	Alarm status	Availability Zone	Public IPv4 DNS	Public IPv4 IP	Elastic IP
MyInstance	i-067fbbaab1265c231	Running	t2.micro	2/2 checks passed	No alarms	+ eu-west-2b	ec2-18-130-211-210.eu...	18.130.231.210	-
MyVATCALCUL...	i-0ff89fcdaa534ce7e	Running	t2.micro	2/2 checks passed	No alarms	+ eu-west-2b	ec2-13-40-74-118.eu-w...	13.40.74.118	-

Below the table, a detailed view of the selected instance ('MyVATCALCUL...') is shown. It includes tabs for Details, Security, Networking, Storage, Status checks, Monitoring, and Tags. Under the Details tab, it shows the Instance ID (i-0ff89fcdaa534ce7e), Public IPv4 address (13.40.74.118), Private IPv4 address (172.31.35.167), Instance state (Running), and Public IPv4 DNS (ec2-13-40-74-118.eu-west-2.compute.amazonaws.com).

Install Docker on your Amazon Linux 2 instance:

```
sudo yum update -y
sudo amazon-linux-extras install docker
sudo service docker start
sudo systemctl enable docker
sudo usermod -a -G docker ec2-user
```

Log out of your instance, then log back in to confirm your permissions

```
docker info
```

```
$ ssh-keygen -m PEM -t rsa -b 4096 -C "yourAWSEmail@email.com"
```

```
$ cat ~/.ssh/id_rsa
```

```
$ cat ~/.ssh/id_rsa.pub >> ~/.ssh/authorized_keys
```

```
[ec2-user@ip-172-31-35-72 ~]$ cat ~/.ssh/id_rsa

Variables

Variables store information, like passwords and secret keys, that you can use in job scripts. [Learn more.](#)

Variables can be:

- Protected: Only exposed to protected branches or tags.
- Masked: Hidden in job logs. Must match masking requirements. [Learn more.](#)

Environment variables are configured by your administrator to be [protected](#) by default.

Type	↑ Key	Value	Protected	Masked	Environments	
Variable	PROD_SERVER_IP	*****	✓	✗	All (default)	
File	SSH_PRIVATE_KEY	*****	✓	✗	All (default)	

[Add variable](#) [Reveal values](#)

Copy the whole private key into a GitLab project [file](#) called:
SSH_PRIVATE_KEY

Copy the AWS EC2 instance's Public IP address into a GitLab project [variable](#) called: **PROD_SERVER_IP**

public IP address of
AWS EC2 instance

VAT CALCULATOR

VAT Rate: ▾

Price excl VAT:

VAT to pay: 0

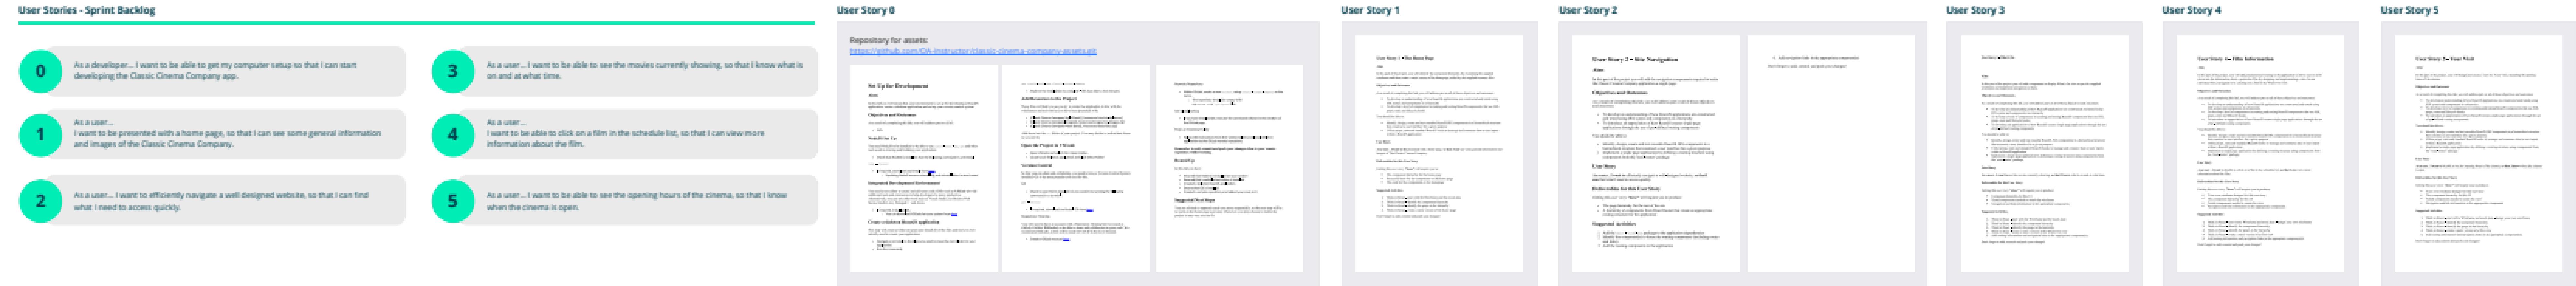

Price incl VAT:

Create a GitLab project and push your React App code to its repository.

Add a GitLab pipeline to the project by adding a special file called: **.gitlab-ci.yml**

The screenshot shows a GitLab project named "vat-calculator". The left sidebar contains navigation links for Project information, Repository, Issues, Merge requests, CI/CD, Security & Compliance, Deployments, Monitor, Infrastructure, Packages & Registries, Analytics, Wiki, Snippets, and Settings. The main content area displays the project's repository details: 22 Commits, 1 Branch, 0 Tags, 440 KB Files, and 49.5 MB Storage. A commit history table lists the following commits:

Name	Last commit	Last update
nginx	Initial commit	3 weeks ago
public	Initialize project using Create React App	3 weeks ago
src	Added comments to pipeline and an Orange...	1 hour ago
.dockercignore	Added blank line to .dockercignore	5 hours ago
.gitignore	Initialize project using Create React App	3 weeks ago
.gitlab-ci.yml	Added comments to pipeline and an Orange...	1 hour ago
Dockerfile	Updated images in Dockerfile	4 hours ago
README.md	Initialize project using Create React App	3 weeks ago
package-lock.json	Initialize project using Create React App	3 weeks ago

  );
}

export default LogIn;
```

```
const Login = () => {
  const [user, setUser] = useState({username: '', password: ''})
  const [isAuthenticated, setAuth] = useState(false);

  const handleChange = (event) => {
    setUser({...user, [event.target.name]: event.target.value})
  }
```

```
const login = () => {
  fetch(SERVER_URL + 'login', {
    method: 'POST',
    body: JSON.stringify(user)
  })
  .then(res => {
    const jwtToken = res.headers.get('Authorization');
    if (jwtToken !== null) {
      sessionStorage.setItem("jwt", jwtToken);
      setAuth(true);
    }
    else {
      toast.warn("Check your username and password", {
        position: toast.POSITION.BOTTOM_LEFT
      })
    }
  })
  .catch(err => console.error(err))
}
```

The React Login component submits (POSTs) the user state object to the REST API's login endpoint and then checks for an **Authorization** Header in the returned **Response** object

It stores the value of the Authorization Header (the sent JSON Web Token (**JWT**)) in Session storage

It then sets the **isAuthenticated** state variable to *true*

```
if (isAuthenticated === true) {
  return (<Carlist />)
}
else {
  return (
    <div>
      <TextField name="username"
        label="Username" onChange={handleChange} /><br/>
      <TextField type="password" name="password"
        label="Password" onChange={handleChange} /><br/><br/>
      <Button variant="outlined" color="primary"
        onClick={login}>
        Login
      </Button>
      <ToastContainer autoClose={1500} />
    </div>
  );
}

export default Login;
```

```
fetchCars = () => {
  // Read the token from the session storage
  // and include it in the Authorization header
  const token = sessionStorage.getItem("jwt");
  fetch(SERVER_URL + 'api/cars',
    {
      headers: { 'Authorization': token }
    })
  .then((response) => response.json())
  .then((responseData) => {
    this.setState({
      cars: responseData._embedded.cars,
    });
  })
  .catch(err => console.error(err));
}
```

All other component functions attach the JWT to the [Request](#) header from Session storage.

```
// Add new car
addCar(car) {
  const token = sessionStorage.getItem("jwt");
  fetch(SERVER_URL + 'api/cars',
    {
      method: 'POST',
      headers: {
        'Content-Type': 'application/json',
        'Authorization': token
      },
      body: JSON.stringify(car)
    })
  .then(res => this.fetchCars())
  .catch(err => console.error(err))
}
```

Repository for Security Backend

https://github.com/QA-Instructor/car_database_jwt.git

Note: The demo uses OIDC/OAuth2 which is no longer a recommended approach to protect public applications. The new recommended approach is to use OAuth2 authorisation code grant with Proof key for code exchange (PKCS). See:

<https://www.taithienbo.com/why-the-implicit-flow-is-no-longer-recommended-for-protecting-a-public-client>

[OAuth 2.0 – OAuth](#)

Microsoft are removing this the old flow in Azure and assume the other big players will follow:

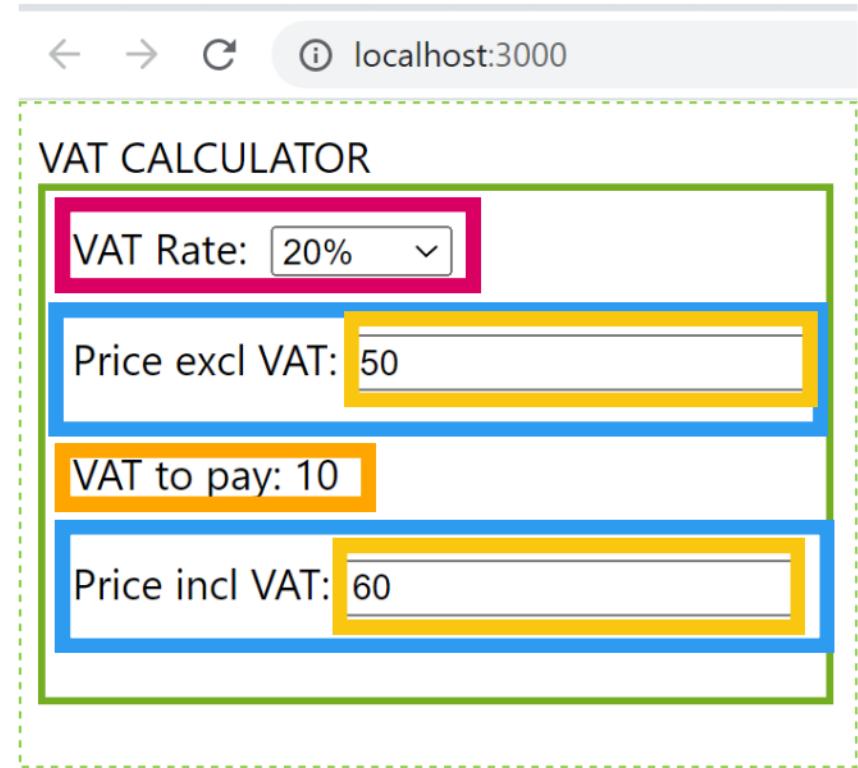

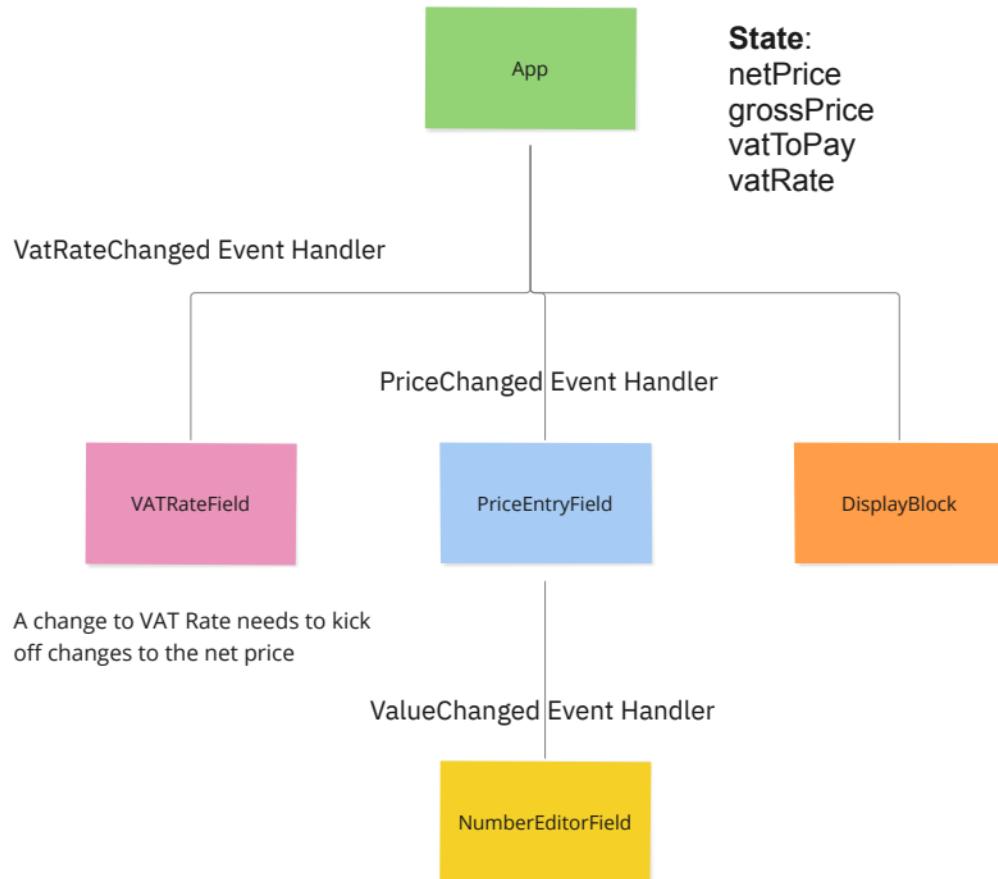

[OAuth 2.0 implicit grant flow - The Microsoft identity platform - Microsoft Entra | Microsoft Learn](#)

Possible framework to help out?

[react-oauth2-code-pkce - npm \(npmjs.com\)](#)

- As a User, I want to be able to leave a review for a movie, so that other users can decide whether the Movie is worth going to see.
- As a User, I want to be able to access the reviews of other users, so that I can access the information I need on the device of my choice.
- As a User, I want to be able to subscribe to the newsletter, so that I can receive the latest promotions and information.
- As a User, I want to be able to login to the device, so that I have access to user specific features like reviews.
- As a User, I want to be able to register to the site, so that I can login to the site and use special features.
